

“Search all areas of GoldMine and external folders either individually or simultaneously”

“Results easily sorted and searched with a direct link back into GoldMine”

Use QuickSearch to perform searches previously impossible in GoldMine.

Using advanced Internet Search Engine technology, information contained within all areas of GoldMine is indexed. The indexes contain **all** the words in the body of emails, contact history notes, linked documents etc, these can then be searched quickly and efficiently.

In addition, external folders (containing, Word, Excel and PDF documents) can also be indexed and searched either individually or simultaneously using a single search phrase. All the **words** in the documents are searchable – not just the document names.

A further benefit is that results from each search are displayed in an easy-to-view grid format and ranked according to relevance of search criteria. Results are easily sorted and searched within the grid.

QuickSearch - makes searching GoldMine as easy as searching the Internet!

By double clicking on a selected result in the grid you will be taken back into GoldMine and the cursor will automatically be positioned on the correct record.

System requirements: Microsoft .Net framework. In order to index PDF documents, you will need Adobe 8 or later.

QuickSearch is designed for any Windows version that is designed to operate with the .NET Framework.

QuickSearch is compatible with all versions of GoldMine from version 5 to 7, including PE. It supports the Dbase and SQL back-ends.

Disk space: Installed programs will need 22 MB. The indexes that are created depend on the amount of data in the GoldMine system. As a rough guide, the indexes will be 20% of the storage occupied by your GoldMine data. In addition, you will need disk space for 10% of the size of any external folders that are indexed.
